Student Database Project

This project consisted of working as a team between two other classmates and I. The main focus of this project revolved around a database of Chicago Public Transportation. The system allows the user to pick from several options to display specific data. Some of these options involve hourly rate, people with specific job positions, train lines running towards a specific direction, department phone numbers and more.

This CTA data is free to the public and so my team and I made it easier for anyone to search various options they were interested in seeing. We worked together to set up the csv files, the SQL databases, as well as the Java coding implementation. Working on this project helped us improve our knowledge with MySQL and overall was a great experience.
